VARIETY OF GERANIUM NAMED 'PENDEC'

BACKGROUND OF THE INVENTION

This discovery relates to a new and distinct cultivar of *Pelargonium x peltatum* known by the varietal name of 'Pendec.' The seedling from the present variety is a spontaneous mutation of 'Pendresd' (patent pending). The new variety was discovered in France on June 22, 1996. The new variety was first asexually reproduced by cuttings at Elsner pac Jungpflanzen in Dresden, Germany on October 15, 1996. It has been found to retain its distinctive characteristics through successive propagations.

The new cultivar has similar flower color and form to 'Pendresd' but is a shorter internode length and has yellower stems than 'Pendresd.' 'Pendresd' is a single flowering pelatum hybrid with white-nacreous and zygomorph flowers. The two upper petals are wider and overlapping with burgundy colored markings. The three more narrow lower petals are not overlapping and do not have any markings.

The cultivar, when grown in a glass greenhouse at high humidity using natural light and 18°C night and 20°C day, has a response time of ten weeks from a rooted cutting to flowering in a 10 cm pot. The response time was determined on plants grown in peat substrates.

DESCRIPTION OF THE DRAWING

The accompanying photographic drawing illustrates the new variety, with the color being as nearly true as is possible with color illustrations of this type.

DESCRIPTION OF THE PLANT

The following detailed descriptions set forth the characteristics of the new variety. The data which define these characteristics were collected from asexual reproductions carried out in [at Elsner pac Jungpflanzen, Kipsdorfer Strasse 146, D-01279,] Dresden, Germany. Observations of the new variety were taken 8 months after rooted cuttings were planted. The color readings were taken

in natural light. Color references are primarily to the Royal Horticultural Society Colour Chart.

GENERAL CHARACTERISTICS

The new geranium variety provides a flower color similar to its parent, 'Pendred,' with a shorter internode length and a different color stem (yellow) using minimal fertilization. It is rich flowering, well-branched, hangs well, and has a stable flower color under intense sunlight. These properties provide an impressive appearance from a distance. Cutting production and wind resistance are excellent.
